

# Data Mining Toolkits in Python

Zheng Li

October 14, 2021

## 1 Overview

## 2 Example 1

- Kaggle Dataset
- Preprocessing: Read dataset and parse attributes
- Preprocessing: Working with Missing Data
- Preprocessing: Noise Reduction
- Data Visualization
- Preprocessing: Data Reduction
- Preprocessing: Partition Continuous Features into Discrete Values
- Classification: Decision Tree

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- Preprocessing: Dimensionality Reduction
- Classification: MLP

# Overview

**Figure:** Click Figure to view popular APIs for data mining.

**numpy** linear algebra algorithm library, operations on the n-dimensional array.

**matplotlib** data visualization.

**pandas** data structures and operations for manipulating tables.

**scipy** optimization, interpolation, statistic, sparse matrix.

**scikit-learn** Preprocessing, Clustering, Classification, Regression

**tensorflow** Parallel Computing.

**keras** Deep Learning.

## 1 Overview

## 2 Example 1

- Kaggle Dataset
- Preprocessing: Read dataset and parse attributes
- Preprocessing: Working with Missing Data
- Preprocessing: Noise Reduction
- Data Visualization
- Preprocessing: Data Reduction
- Preprocessing: Partition Continuous Features into Discrete Values
- Classification: Decision Tree

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- Preprocessing: Dimensionality Reduction
- Classification: MLP

# Titanic - Machine Learning from Disaster

This is a classical data set in Kaggle, it consists of

`train.csv` This table contains all the train data(features and labels).

`test.csv` This table contains the feature attributes of the test data.

`gender_submission.csv` This table contains the label attributes of the test data.

While using python data mining toolkits, we do not have to know the exact meaning of each attribute or the background of the dataset, because the preprocessing and data visualization can help us parse the attributes.

## 1 Overview

## 2 Example 1

- Kaggle Dataset
- **Preprocessing: Read dataset and parse attributes**
- Preprocessing: Working with Missing Data
- Preprocessing: Noise Reduction
- Data Visualization
- Preprocessing: Data Reduction
- Preprocessing: Partition Continuous Features into Discrete Values
- Classification: Decision Tree

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- Preprocessing: Dimensionality Reduction
- Classification: MLP

# Read dataset and parse attributes

When we already obtain the dataset, the first step is reading the dataset to the RAM.

```
train = pd.read_csv("datasetstrain.csv")
```

Combining data from two or more tables, based on the primary key.

```
test = pd.merge(  
    left=pd.read_csv("datasetsgender_submission.csv"),  
    right=pd.read_csv("datasetstest.csv"),  
    on="PassengerId")
```

## Remark

Pandas is a hybrid of Python and SQL language. Many python-based web frameworks(ex. Django) use Pandas instead of traditional SQL operations.

It is convenient to view all the fields of the table by one-line command.

```
train.info()
```

# Read dataset and parse attributes

The main usage of printing this table is to help us to work with the missing data.

```
===== Attributes Summary =====  
<class 'pandas.core.frame.DataFrame'>  
RangeIndex: 891 entries, 0 to 890  
Data columns (total 12 columns):  
#   Column      Non-Null Count  Dtype  
---  ---  
0   PassengerId  891 non-null    int64  
1   Survived     891 non-null    int64

- Preprocessing: Partition Continuous Features into Discrete Values
- Classification: Decision Tree

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- Preprocessing: Dimensionality Reduction
- Classification: MLP

# Working with Missing Data

Filling missing values with a new class

```
train["Cabin"] = train["Cabin"].fillna("None")
```

Filling missing values with the mean value

```
train["Age"] = train["Age"].fillna(train["Age"].mean())
```

Dropping samples with missing attributes.

```
train = train.dropna()
```

Of course, we must do the same implementation in the testing dataset.  
After working with the missing data, It is convenient to view the statistics by one-line command.

```
print(train.describe())  
print(test.describe())
```

# Working with Missing Data

The main usage of printing this table is to help us to remove the noise.

## 1 Overview

## 2 Example 1

- Kaggle Dataset
- Preprocessing: Read dataset and parse attributes
- Preprocessing: Working with Missing Data
- **Preprocessing: Noise Reduction**
- Data Visualization
- Preprocessing: Data Reduction
- Preprocessing: Partition Continuous Features into Discrete Values
- Classification: Decision Tree

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- Preprocessing: Dimensionality Reduction
- Classification: MLP

# Noise Reduction

From the statistics above, we find that

- `train["Parch"].mean()  $\approx$  test["Parch"].mean()`
- `train["Parch"].std()  $\approx$  test["Parch"].std()`
- `train["Parch"].max()  $\approx$  test["Parch"].max()`

It implies that there exists noise in the attribute 'Parch'. One-line command to remove such noise.(It is equivalent to the 'where' command in SQL language)

**`test = test[test["Parch"]  $\leq$  8]`**

We also notice that `train["Fare"].std()  $\gg$  1`, it implies that there exists noise in the attribute 'Fare'. We can use cluster algorithm to remove such noise.

## 1 Overview

## 2 Example 1

- Kaggle Dataset
- Preprocessing: Read dataset and parse attributes
- Preprocessing: Working with Missing Data
- Preprocessing: Noise Reduction
- **Data Visualization**
- Preprocessing: Data Reduction
- Preprocessing: Partition Continuous Features into Discrete Values
- Classification: Decision Tree

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- Preprocessing: Dimensionality Reduction
- Classification: MLP

# Data Visualization

Except printing the 'describe' table, we can also use data visualization to help us with data preprocessing.

## 1 Overview

## 2 Example 1

- Kaggle Dataset
- Preprocessing: Read dataset and parse attributes
- Preprocessing: Working with Missing Data
- Preprocessing: Noise Reduction
- Data Visualization
- **Preprocessing: Data Reduction**
- Preprocessing: Partition Continuous Features into Discrete Values
- Classification: Decision Tree

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- Preprocessing: Dimensionality Reduction
- Classification: MLP

# Data Reduction

From the data visualization above, we find that the attribute 'Cabin' contains too many classes, make the correlation analysis to check the validity of this attribute.

```
cross_table = pd.crosstab(train["Cabin"].values,  
train["Survived"].values)  
if stats.chi2_contingency(observed=cross_table.values)[1] < 0.05:  
    train = train.drop(columns=["Cabin"])  
    test = test.drop(columns=["Cabin"])
```

Since  $p_{val} = 2.71e - 06$ , we need drop this field. Check the information of the two datasets again to have a view of the attributes.

```
train.info()  
test.info()
```

# Data Reduction

These tables show us, the attributes contain continuous values and discrete values, so we have to convert them into the same datatype in the next step.

```
===== Data Reduction =====  
<class 'pandas.core.frame.DataFrame'>  
Int64Index: 836 entries, 0 to 890  
Data columns (total 8 columns):  
#   Column      Non-Null Count  Dtype  
---  ---  
0   Survived    836 non-null    int64  
1   Pclass      836 non-null    int64

7   Embarked    386 non-null    object  
dtypes: float64(2), int64(4), object(2)  
memory usage: 27.1+ KB
```

(b) Test

# Contents

## 1 Overview

## 2 Example 1

- Kaggle Dataset
- Preprocessing: Read dataset and parse attributes
- Preprocessing: Working with Missing Data
- Preprocessing: Noise Reduction
- Data Visualization
- Preprocessing: Data Reduction
- **Preprocessing: Partition Continuous Features into Discrete Values**
- Classification: Decision Tree

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- Preprocessing: Dimensionality Reduction
- Classification: MLP

# Partition Continuous Features into Discrete Values

By using the histogram above, the continuous variables can be binning easily.

```
train["Age"] = (train["Age"] // 16) * 16  
train["Fare"] = (train["Fare"] // 19) * 19  
test["Age"] = (test["Age"] // 16) * 16  
test["Fare"] = (test["Fare"] // 19) * 19
```

## Remark

- For different attributes, we can use different standards in binning the values. but for the same attribute in different datasets, we must obey the same rule when binning the values.
- when we using clustering methods to discrete the continuous values, we should make sure the class is sorted in order.

Now the data preprocessing is completed. Let's view these two tables

```
print(train)  
print(test)
```

# Data Reduction

```
===== Discretization =====

- Preprocessing: Partition Continuous Features into Discrete Values
- **Classification: Decision Tree**

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- Preprocessing: Dimensionality Reduction
- Classification: MLP

# Decision Tree

## Step 1: Converting tables to n-dimensional arrays

```
train['Sex'] = train['Sex'].map('male': 0, 'female': 1).astype(int)
train['Embarked'] = train['Embarked'].map('S': 0, 'C': 1, 'Q': 2).astype(int)
x_train = train[["Pclass", "Sex", "Age", "SibSp", "Parch", "Fare", "Embarked"]].values
y_train = train["Survived"].values
```

Of course, we must do the same implementation in the testing dataset.

## Step 2: Training the model

```
decision_tree = tree.DecisionTreeClassifier()
decision_tree.fit(x_train, y_train)
```

## Step 3: Computing the accuracy

```
y_pred = decision_tree.predict(x_test)
print("Train accuracy: {} %".format(round(decision_tree.score(x_train, y_train) * 100, 2)))
print("Test accuracy: {} %".format(round(decision_tree.score(x_test, y_test) * 100, 2)))
```

```
===== Decision Tree =====
Train accuracy: 87.56
Test accuracy: 81.35
```

# Decision Tree

## Step 4: Printing the Decision Tree

```
print(tree.export_text(decision_tree, feature_names=["Pclass", "Sex", "Age", "SibSp",  
"Parch", "Fare", "Embarked"]))
```

```
|--- Sex <= 0.50  
|   |--- Pclass <= 1.50  
|   |   |--- Fare <= 9.50  
|   |   |   |--- class: 0  
|   |   |   |--- Fare > 9.50  
|   |   |       |--- Age <= 56.00  
|   |   |       |   |--- Parch <= 1.50  
|   |   |       |       |--- Fare <= 28.50  
|   |   |       |       |   |--- Age <= 40.00  
|   |   |       |       |       |--- Parch <= 0.50  
|   |   |       |       |       |   |--- Age <= 24.00  
|   |   |       |       |       |       |--- Embarked <= 0.50  
|   |   |       |       |       |       |   |--- class: 1  
|   |   |       |       |       |       |   |--- Embarked > 0.50  
|   |   |       |       |       |       |       |--- class: 0
```

# Encoding Categorical Attributes

Before using any Neural Network to do the classification task, we have to convert the Categorical Values to vectors. The most popular encoding algorithm is one-hot. It is widely used in classification tasks.

```
encoder = preprocessing.OneHotEncoder()  
encoder.fit(train[["Pclass", "Sex", "Embarked"]].values)
```

## Example

The output of `encoder.transform([[3, "male", "Q"], [3, "female", "S"]])` is

```
===== Encoding Categorical Features =====  
[[3, 'male', 'Q'], [3, 'female', 'S']] ->  
[[0. 0. 1. 0. 1. 0. 1. 0.]  
 [0. 0. 1. 1. 0. 0. 0. 1.]]
```

## 1 Overview

## 2 Example 1

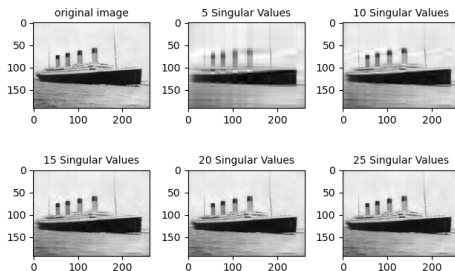

- Kaggle Dataset
- Preprocessing: Read dataset and parse attributes
- Preprocessing: Working with Missing Data
- Preprocessing: Noise Reduction
- Data Visualization
- Preprocessing: Data Reduction
- Preprocessing: Partition Continuous Features into Discrete Values
- Classification: Decision Tree

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- **Preprocessing: Dimensionality Reduction**
- Classification: MLP

# Dimensionality Reduction

Before constructing a neural network, We can use PCA to reduce the dimension of features. PCA is an SVD-based method. Its core is to remain the parts with high Singular Values which is similar to the image compression technology.

## Remark

For Deep Learning, PCA is not necessary.

## 1 Overview

## 2 Example 1

- Kaggle Dataset
- Preprocessing: Read dataset and parse attributes
- Preprocessing: Working with Missing Data
- Preprocessing: Noise Reduction
- Data Visualization
- Preprocessing: Data Reduction
- Preprocessing: Partition Continuous Features into Discrete Values
- Classification: Decision Tree

## 3 Example 2

- Preprocessing: Encoding Categorical Attributes
- Preprocessing: Dimensionality Reduction
- Classification: MLP

**Step 1:** Converting tables to n-dimensional arrays

```
x_train = np.concatenate([
    encoder.transform(train[["Pclass", "Sex", "Embarked"]].values).toarray(),
    train[["Age", "SibSp", "Parch", "Fare"]].values
], axis=1)
y_train = train["Survived"].values
```

Of course, we must do the same implementation in the testing dataset.

**Step 2:** Build the model

```
model = tf.keras.models.Sequential([
    tf.keras.layers.Dense(512, activation='relu'),
    tf.keras.layers.BatchNormalization(),
    tf.keras.layers.Dense(256, activation='relu'),
    tf.keras.layers.BatchNormalization(),
    tf.keras.layers.Dense(128, activation='relu'),
    tf.keras.layers.BatchNormalization(),
    tf.keras.layers.Dense(2)
])
model.compile(
    optimizer=tf.keras.optimizers.Adam(0.005),
    loss=tf.keras.losses.SparseCategoricalCrossentropy(from_logits=True),
    metrics=['accuracy'])
```

### Step 3: Training the model

```

model.fit(
    x_train, y_train, batch_size=4, epochs=20,
    validation_data=(x_test, y_test),
    callbacks=[
        tf.keras.callbacks.LearningRateScheduler(lambda epoch, lr: 0.75 ** (epoch // 10) * lr,
        verbose=1),
        tf.keras.callbacks.TensorBoard(log_dir="logs/" +
        datetime.now().strftime("%Y%m%d-%H%M%S"), histogram_freq=1)
    ],
)

```

The computer will print the training logs in the terminal

```

Epoch 1/20
Epoch 00001: LearningRateScheduler reducing learning rate to 0.004999999888241291.
209/209 [=====] - 3s 9ms/step - loss: 0.9013 - accuracy: 0.6268 - val_loss: 0.8936 - val_accuracy: 0.6140
...
Epoch 5/20
Epoch 00005: LearningRateScheduler reducing learning rate to 0.004999999888241291.
209/209 [=====] - 1s 7ms/step - loss: 0.6307 - accuracy: 0.6644 - val_loss: 0.3849 - val_accuracy: 0.8860
...
Epoch 9/20
Epoch 00009: LearningRateScheduler reducing learning rate to 0.004999999888241291.
209/209 [=====] - 1s 7ms/step - loss: 0.6103 - accuracy: 0.6716 - val_loss: 0.2228 - val_accuracy: 0.9715
...

```

# Tensorboard

**Step 4:** Open the tensorboard to view the data plot of training logs in a web browser.

```
$ tensorboard --logdir logs
```

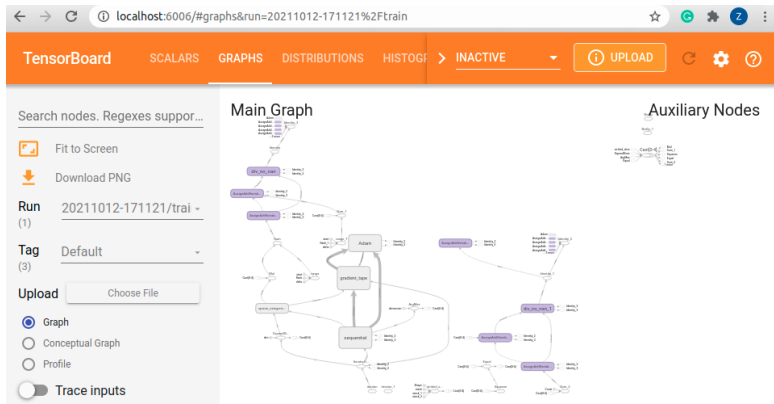

Figure: Computational Graph

# TensorBoard

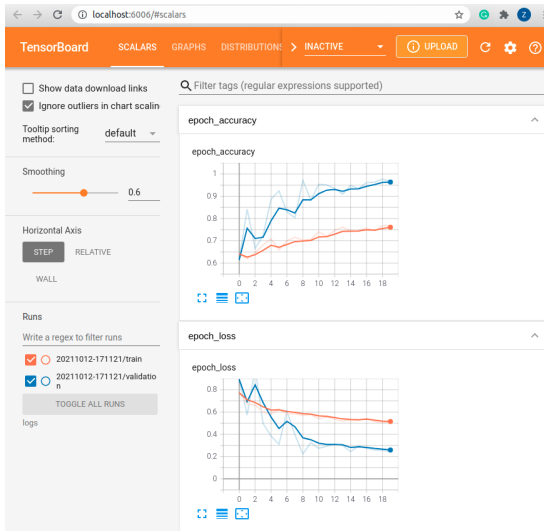

Figure: Loss and Accuracy

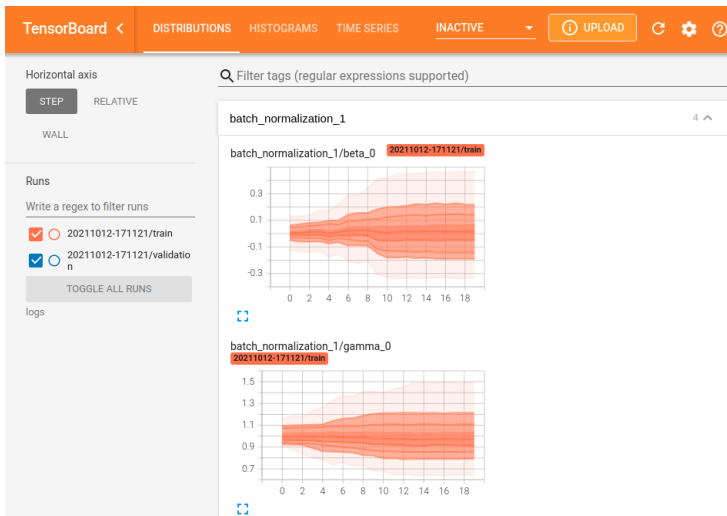

Figure: Distributions of model parameters

# Tensorboard

Figure: Histogram of model parameters
